

# SigiStudio INTERSERV M

## Browser access for media archive

Our flexible image and media archive SigiStudio MediAsset is a standard for many television and video production facilities.

The SigiStudio client software provides a comfortable, graphical user interface, which supports all integrated and authorized systems in a heterogeneous studio environment. Production systems, still stores, video server and systems like Quantel paintboxes, Unix Computers or Macs can be controlled or addressed. Many tasks do not require complete access to the full environment. A comfortable tool which allows the user to select media from the archive often is sufficient.

SigiStudio INTERSERV M is the suitable tool to search for image and media data using standard browser software - like Microsoft Internet Explorer or Netscape Communicator - and combine the results in production or order list suggestions.

SigiStudio INTERSERV M-option supports a comfortable and very fast retrieval in the complete data pool with context functionality. The user does not need any knowledge regarding the data structure of the archive. The results are presented clearly, the list shows few important information and only those media for which the copyright allows the use for further productions. Selected media can be inserted into a production or order list and directly be transferred to the archive or graphics department. The email transfer of the corresponding list including the necessary browse images is possible.

### Important features
