

# SigiStudio Chyron- Search, ChyronServ, ChyronWriter, ChyronPlay

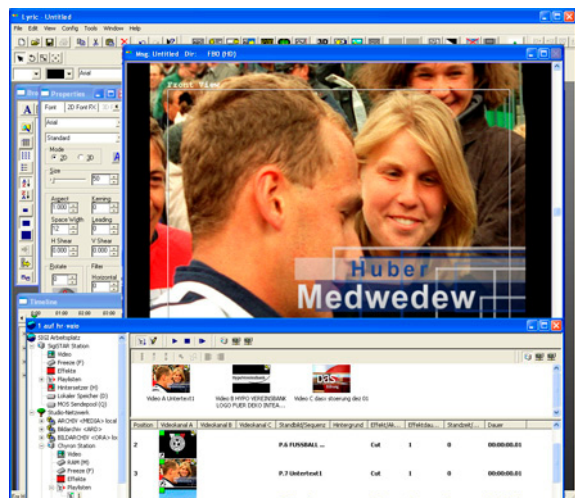

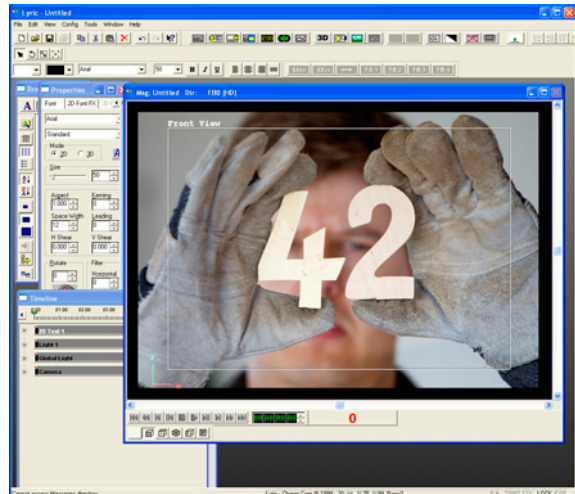

## Integration of Chyron systems

Many video production facilities use media archives, Q-Server and video stations from Signum to store and handle different media. If a user wants to create a template or a graphic with Lyric software on a Chyron system he needs direct access to the SigiStudio environment for media retrieval and selection.

ChyronSearch is a new Plugin for Lyric software to support comfortable media data handling. If graphic templates should be used not only locally ChyronServ provides a link into the MediAsset content management system. Chyron templates, including all necessary objects like 3D objects or avi-files, may be stored inside the SigiStudio environment and be transferred between various systems via network.

SigiStudio is a powerful software for live productions. Now you are able to play out graphic templates using SigiStudio play lists. ChyronPlay, a specially designed station software, uses the same control features like SIGI plus or SigiSTAR video production systems on Chyron hardware. Chyron MOSPlay is the perfect interface to Newsroom or automation systems allowing connecting Chyron systems to the SigiStudio MOS-Server.

## Important features

- Lyric Plugin for direct use of SigiSTAR and SigiStudio media inside a Chyron environment
- SigiStudio textwriter use text render functionality of Chyron
- Control of Chyron systems using SigiStudio windows client software or SigiStudio internet browser software
- Playout of text charts, animated templates and 3D objects using SigiStudio play lists or SigiStudio MOSServer
