

SigiStudio for Profile

Graphical user interface

The SigiSTAR system series provide several digital video systems, which can be used for video productions to playback and record stills and clips. The core of the SigiSTAR application is a powerful media/image archive which is able to handle sequences, clips and stills. Standard editor's workstations e. g. based on Windows PCs or Internet browsers, can be used to access to the media database. If the convenient image material is found, a production can be defined and an automatic transfer of the necessary images via network to a selected production system in a studio can be initialized. Now the definition of a play list, including stills and clips or sequences is possible.

The SigiSTAR hardware provides uncompressed serial digital video and optional 16:9 format up to 360 Mbit/s. If an application is able to use compressed digital video data or if there is need to work with longer video clips, we support Thomson Grass Valley Profile systems. SigiStudio provides the same graphical user interface as for SigiSTAR video systems. There is no difference controlling SigiSTAR or Profile systems.

SigiStudio is able to control single Thomson Grass Valley Profile systems, hybrid systems using SigiSTAR with integrated Profile or SigiSTAR systems alone.

Important features

- Intuitive use with structure similar to Windows Explorer
- Display of device contents with image icons or extensive lists including details
- Selection of productions and play lists using drag and drop functionality
- All important functions can be controlled by mouse or keyboard
- Network access to different video stations and video servers in a studio environment from a single client
- Control of clip recording with or without key channel
- Edit functions to combine clips or merge single images to a clip
- Creation of play lists for image and clip output using 1, 2, 3, 4 or more video channels
- Control of synchronous multi channel Playout
- Play lists can be also controlled by control panel
- Comfortable production mode with graphic control of running productions
- Standalone Playout solution including Audio support with SigiSTAR production system
