

SigiSTAR fader & control panel

For production environments

Most users control the SigiSTAR systems by the comfortable graphical user interface SigiStudio, also during live video productions. If there is need, to use play lists from different positions or to have a quick access to production images with limited room for keyboard, mouse and monitor or during a fail function of the network based graphical user interface, the SigiSTAR control panel is the right choice.

After creating play lists with the graphical SigiStudio Software the Playout can be done with SigiStudio and/or with one or more SigiSTAR control panels.

If there is need to use fade/wipe effects not only with predefined transition time but also with manual interactions the optional SigiSTAR Fader Panel is available. During the production mode, the fader panel can be used to control the transition time in a play list manually. After a complete movement of the fader handle, the next entry in a play list is selected automatically. Before reaching the final touch, it is possible to fade / wipe back to the start image.

Important features

- Control panel for SigiSTAR systems with two-line, large and blue fluorescence display, excellently visible in dark production rooms
- Numeric keys and function keys with LED's using different colours to show system status
- Optional SigiSTAR Fader Panel can be used with or without SigiSTAR Control Panel
- Separate power unit for 230V connection for each of the panels
- Serial connection to SigiSTAR systems for each of the panels using RS-232 or RS-422 interface up to 38.4 kBaud
