

SigiStudio Graphics Archiv

Archiving of graphic files within the SigiStudio-Environment

The Graphics Archive SigiStudio supports all common formats as well as Photoshop psd-files, Lyric-files from Chyron character generators and Quantel-files.

Photoshop

At archiving nobody loses any feature of the psd-file format. While importing the IPTC-metadata (optional XMP-data) are written into the database for comfortable full-text-retrieval.

Drag 'n' drop functionality is supported with Photoshop. No layers or metadata will be lost while editing. The database will be refreshed while restore.

Chyron

Chyron is also supported by our Signum-System. All effects, rolls, crawls, animations etc. will be kept if the lyric-file is stored. With the comfortable retrieval within the Chyron-Plug-in, there is a full support of all features of the Chyron-files.

Quantel

The SigiStudio-Plug-Ins enables the usage together with Quantel products of the generationQ (eQ, iQ) series. It is directly implemented within the SigiStudio-Graphics-Archive. The user is able to retrieve and choose in the easiest way from all pictures or graphics from the archive.

It is possible to modify the metadata of several pictures simultaneously with the SigiStudio Web-GUI (batch modification). There is unlimited access to any archive, not only to one of them, if available and desired. The user has full access to the entire SigiStudio environment, i. e. all servers and even MOS-pools, direct out of the Plug-in.

There is no better way to get pictures from Photoshop live to play out.
