The imageserver software SIGNUM MOTION is the central software for the editing and display of digital image data. All raw data (e. g. of the KODAK RO/HG-cameras, HS4540, Weinberger, Photosonics) are edited by this software and compiled for further processing.

Notes can be entered in the Multimedia-Exchange (MME) format on a test and thus be made available for other users. The imageserver is also able to use special functions for synchronous display of sequences and diagrams of externally received data and video analysis.

It is possible to examine, edit, enhance and display single frames and to convert entire sequences in sequence file formats (e. g. AVI) and any other single file formats.

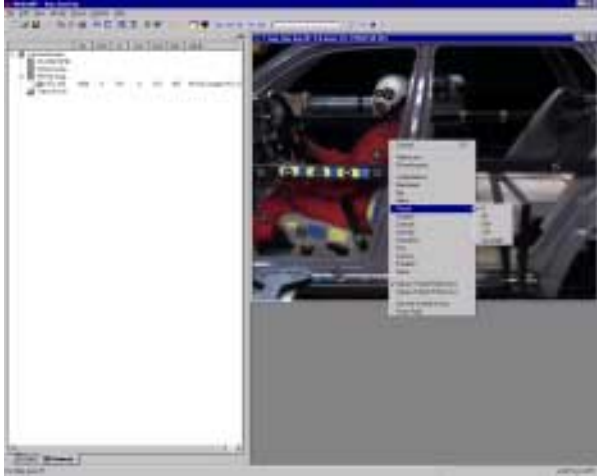

The integrated realtime player is capable to display sequences immediately after downloading to the Imageserver. Thus it is not necessary to convert movies into AVIs to view the results! Specialized algorithms to convert video raw data achieve an improved image quality. They allow the exact determination of an object's position with additional algorithms.

A variety of high speed cameras can be controlled with the Multi Camera Interface. It is possible to set the parameters for each camera and control the imager.

While recording the video data is stored in the RAM of the imager. After the recording the data is transferred to the imageserver.

Additional devices like film and video scanners can be integrated in the Imageserver.

The Motion NT Imageserver can handle all video data. The data can be transferred automatically from the crash facility to a database.

The integrated Telnet server (option) controls all connected cameras types through a standard network protocol.

The cameras can also be controlled with digital signals from the track system PLC .

Important features

The combination of digital high speed cameras with the MotionNT Imageserver offers many advantages to the users:

- **standard recording conditions**
camera configuration stored in a database
- **remote control of different camera types**
control of the imager
triggering
testing
- **visual control of all camera views before the test**
live video signal on VGA or video monitor
quick look through computer interface
- **transfer of the digital video data** via
ethernet, scsi, firewire, etc.

- **Telnet server (option) for remote control of all camera types via standard network protocol from external applications**
- **Real time player for displaying video data immediately after download.**
 - * No data conversion to avi necessary
- **Processing and displaying of video material**
 - * Conversion into TIF, BMP, DIB, JPEG....
conversion into video formats like AVI, MPEG
- **Quicklook function with image enhancement e.g.:**
 - * white balance
 - * contrast
 - * intensity
 - * color space manipulations
 - * sharpen
 - * rotation, mirror
 - * export of data into the clipboard
 - * printing of images
 - * display of sequences synchronised with measurement data (DIADEM, ISO, PIAS, LEAR, MOTION etc.)
- **Interfaces to company video archives**
- **Integrated CD recording**
- **Storage of test data in MME format for exchange with other companies and departments**
