

# MOTION web IMAGE ARCHIVE

Media archive for still images, sequences, diagrams and other test results

**MOTION ImageArchive** is a media archive with a comfortable, browser based user interface, which was designed to store still images, sequences, diagrams and other test results in a multiuser environment.

Every standard browser (Microsoft, Netscape) can be used without the need for a specific client software. You are able to work with a host computer, based on Windows, MAC or Unix. Selected media can be previewed and marked for a (order) basket, to be transferred later, according to the user access rights with reduced or full data quality to a selected destination system.

The administration of descriptions is done in an attached database, normally based on ORACLE. All media data are handled only by the SIGNUM media server, which converts to all necessary data formats and automatically creates all formats for a quick preview during data import.

The import can be handled manually by drag and drop and upload or an optional autoimport server is transferring complete MME data structures into the media archive.

An integrated user access management is able to log all data use and may be used later for cost calculations.

## Important Features

- Media Archive with web based user interface to be used without specific client software
- Manual data import by upload (browser) or drag and drop with Windows software
- optional Autoimport Server for automatic import of complete MME- data structure into Media Archive
- Database (Oracle) used for administration of text description
- SIGNUM Media Server to handle and convert all kind of media data
